INTRODUCTION

The SEM206/TH is a “smart” in head transmitter that accepts thermistor temperature sensors and converts the sensor output over a configured range to a standard industrial (4 to 20) mA transmission signal. The output signal is linear to temperature. A variety of thermistor types are available when using USBSpeedLink configuration software. Please consult your supplier for custom thermistors.

In addition to the PC configuration feature, simple push button operation allows the user to select the desired temperature range manually, by either simulating the thermistor temperature with a resistance box or setting the thermistor sensor to the required calibration point and pressing button to store at both 4 mA and 20 mA points.

The SEM206TH in head transmitter incorporates the latest digital technology to ensure accurate drift free performance.

PUSH BUTTON CONFIGURATION

A single push button and LED indicator allows the user to configure transmitter range against a manually set input condition. A red LED is included to help guide the user. The LED also operates as a sensor error indicator.

PC CONFIGURATION

PC configuration requires USBSpeedLink software together with a USB configuration kit. The software allows the operator to select from a variety of thermistor types, then set the required temperature range for a (4 to 20) mA output.
For diagnostic purposes the software is capable of reading or logging live data information.
